\* Data as of week no. 22, 31 May 2018

#### **AFP Case Definition:**

Any case of AFP in a child aged <15 years, or any case of paralytic illness in a person of any age when polio is suspected.

Acute: rapid progression of paralysis from onset to maximum paralysis

Flaccid: loss of muscle tone, "floppy" - as opposed to spastic or rigid

Paralysis: weakness, loss of voluntary movement

Any case meeting this definition undergoes a thorough investigation to determine if the paralysis is caused by polio.

#### Measles Case Definition:

#### Suspected case of measles:

A patient in whom a health- care worker suspects measles infection, OR a patient with fever and maculo-papular (non-vesicular) rash.

Laboratory confirmed measles: A suspected case of measles, that has been confirmed by a proficient laboratory

**Epidemiologically linked confirmed case of measles:** A suspected case of measles, that has not been confirmed by a laboratory but was geographically and temporally related, with dates of rash onset occurring 7 - 21 days apart to a laboratory confirmed case, or, in the event of a chain of transmission to another epidemiologically confirmed measles case.

Clinically compatible measles case: A case with fever and maculo-papular (non-ve-sicular) rash and one of cough, coryza or conjunctivitis for which no adequate clinical specimen was taken and which has not been linked epidemiologically to a laboratory confirmed case of measles or another laboratory-confirmed communicable diseases.

#### **CRS Surveillance**

#### Congenital Rubella Syndrome (CRS) Standard Case Definitions

Classification of cases for CRS surveillance purposes is based on clinical, epidemiological and laboratory data. The case definitions for CRS surveillance include the following categories: suspected, laboratory confirmed, clinically compatible, epidemiologically linked and discarded.

### Case definition for Diphtheria surveillance

#### Clinical description

An upper respiratory tract illness characterized by sore throat, low-grade fever, and an adherent membrane of the tonsil(s), pharynx, and/or nose. <u>Laboratory criteria:</u> Isolation of C. diphtheriae from a clinical specimen, OR Histopathologic diagnosis of diphtheria.

#### **Whooping Cough Case Definitions**

#### Clinical case definition

In the absence of a more likely diagnosis a cough illness lasting ≥2 weeks with one of the following symptoms: Paroxysms of coughing, OR Inspiratory "whoop," OR Post tussive vomiting, OR Apnea (with or without cyanosis) (FOR INFANTS AGED <1 YEAR ONLY)

#### **Confirmed Case definition of Neonatal Tetanus:**

Any neonate with normal ability to suck and cry during first two days and who during 3 to 28 days cannot suck or cry and has convulsion or spasms, by triggered by minimal stimuli such as light, noise or touch or who has signs of stiffness and rigidity, which include any of the following: trismus, clenched fists or fits, continuously pursed lips, curved back (opisthotonus).

## Surveillance of AES

### All cases of acute encephalitis syndrome should be reported

Clinical case definition: A person of any age, in any geographical region, at any time of year with acute onset of fever and a change in mental status (including symptoms such as confusion, disorientation, coma, or inability to talk) AND/OR new onset of seizures (excluding simple febrile seizures).

### **AFP Surveillance Indicators (core indicators)**

|                            |             | •   |          |
|----------------------------|-------------|---|----------|
| Indicator                  | Target      | Calculation                                       | -        |
| 1. Non-polio AFP rate      | = 2/100,000 | No. of discarded non-polio AFP cases among        |          |
|                            |             | 15 years of age group                             | x 100000 |
|                            |             | Total number of children < 15 years of age        |          |
| 2. Reported AFP cases with | = 80%)      | No of AFP cases with 2 specimens collected within | -        |
| 2 specimens collected = 14 |             | 14 days of paralysis onset                        | x 100    |
| days since onset.          |             | Total number of children < 15 years of age        |          |
|                            |             |   |          |

#### Measles Surveillance Indicators (core indicators)

| Indicator  | Target                                     | Definition   |
|--|--|--|
| Disease incidence Annual incidence of confirmed measles cases Annual incidence of confirmed rubella cases  | Absence of indigenous measles transmission | The numerator is the confirmed number of measles or rubella cases of the year denominator is the population in which the cases occurred multiplied by 1,000,000. When numerator is zero, the target incidence would be zero. |
| Proportion of sub-national<br>administrative units reporting<br>at least 2 discarded non<br>measles, non rubella cases per<br>100,000 population | >80%                                       | The numerator is the number of sub-national units reporting at least 2 discarded non-measles non rubella cases per 100,000 and the denominator is the total number of sub-national units multiplied by 100                   |
